

## HIGH PERFORMANCE CURRENT MODE PWM CONTROLLERS

### ■ DESCRIPTION

The HG UC3844/3845 are high performance fixed frequency current mode controllers that specifically designed for Off-Line and DC to DC converter applications with minimal external parts count.

The differences between **UC3844** and **UC3845** are the maximum duty cycle ranges and under-voltage lockout thresholds. The **UC3844** ideally suited to off-line applications with UVLO thresholds of  $16V_{(ON)}$  and  $10V_{(OFF)}$ , and **UC3845** has UVLO thresholds of  $8.5V_{(ON)}$  and  $7.6V_{(OFF)}$  for lower voltage applications.

### ■ PIN CONFIGURATION

■ PIN DESCRIPTION

PIN NO	PIN NAME	FUNCTION
1	Compensation	Error amplifier output, this pin is made available for loop compensation.
2	V <sub>FB</sub>	Voltage Feedback, the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	I <sub>SENSE</sub>	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	R <sub>T</sub> /C <sub>T</sub>	The Oscillator frequency and maximum output duty cycle are programmed by connecting resistor R <sub>T</sub> to V <sub>REF</sub> and capacitor C <sub>T</sub> to ground. Operation to 1 MHz is possible.
5	GND	Power ground.
6	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin. The output switches at one-half the oscillator frequency.
7	V <sub>CC</sub>	Positive supply.
8	V <sub>REF</sub>	Reference output, provides charging current for capacitor C <sub>T</sub> though resistor R <sub>T</sub> .
